

Random Access

cylinder = set of similar tracks for all platters

Cost of a Random Access

1. seek-time t_s (arm movement)

2. rotational delay t_r (wait for the right angle)

$$12000 \text{ RPM} / 60$$

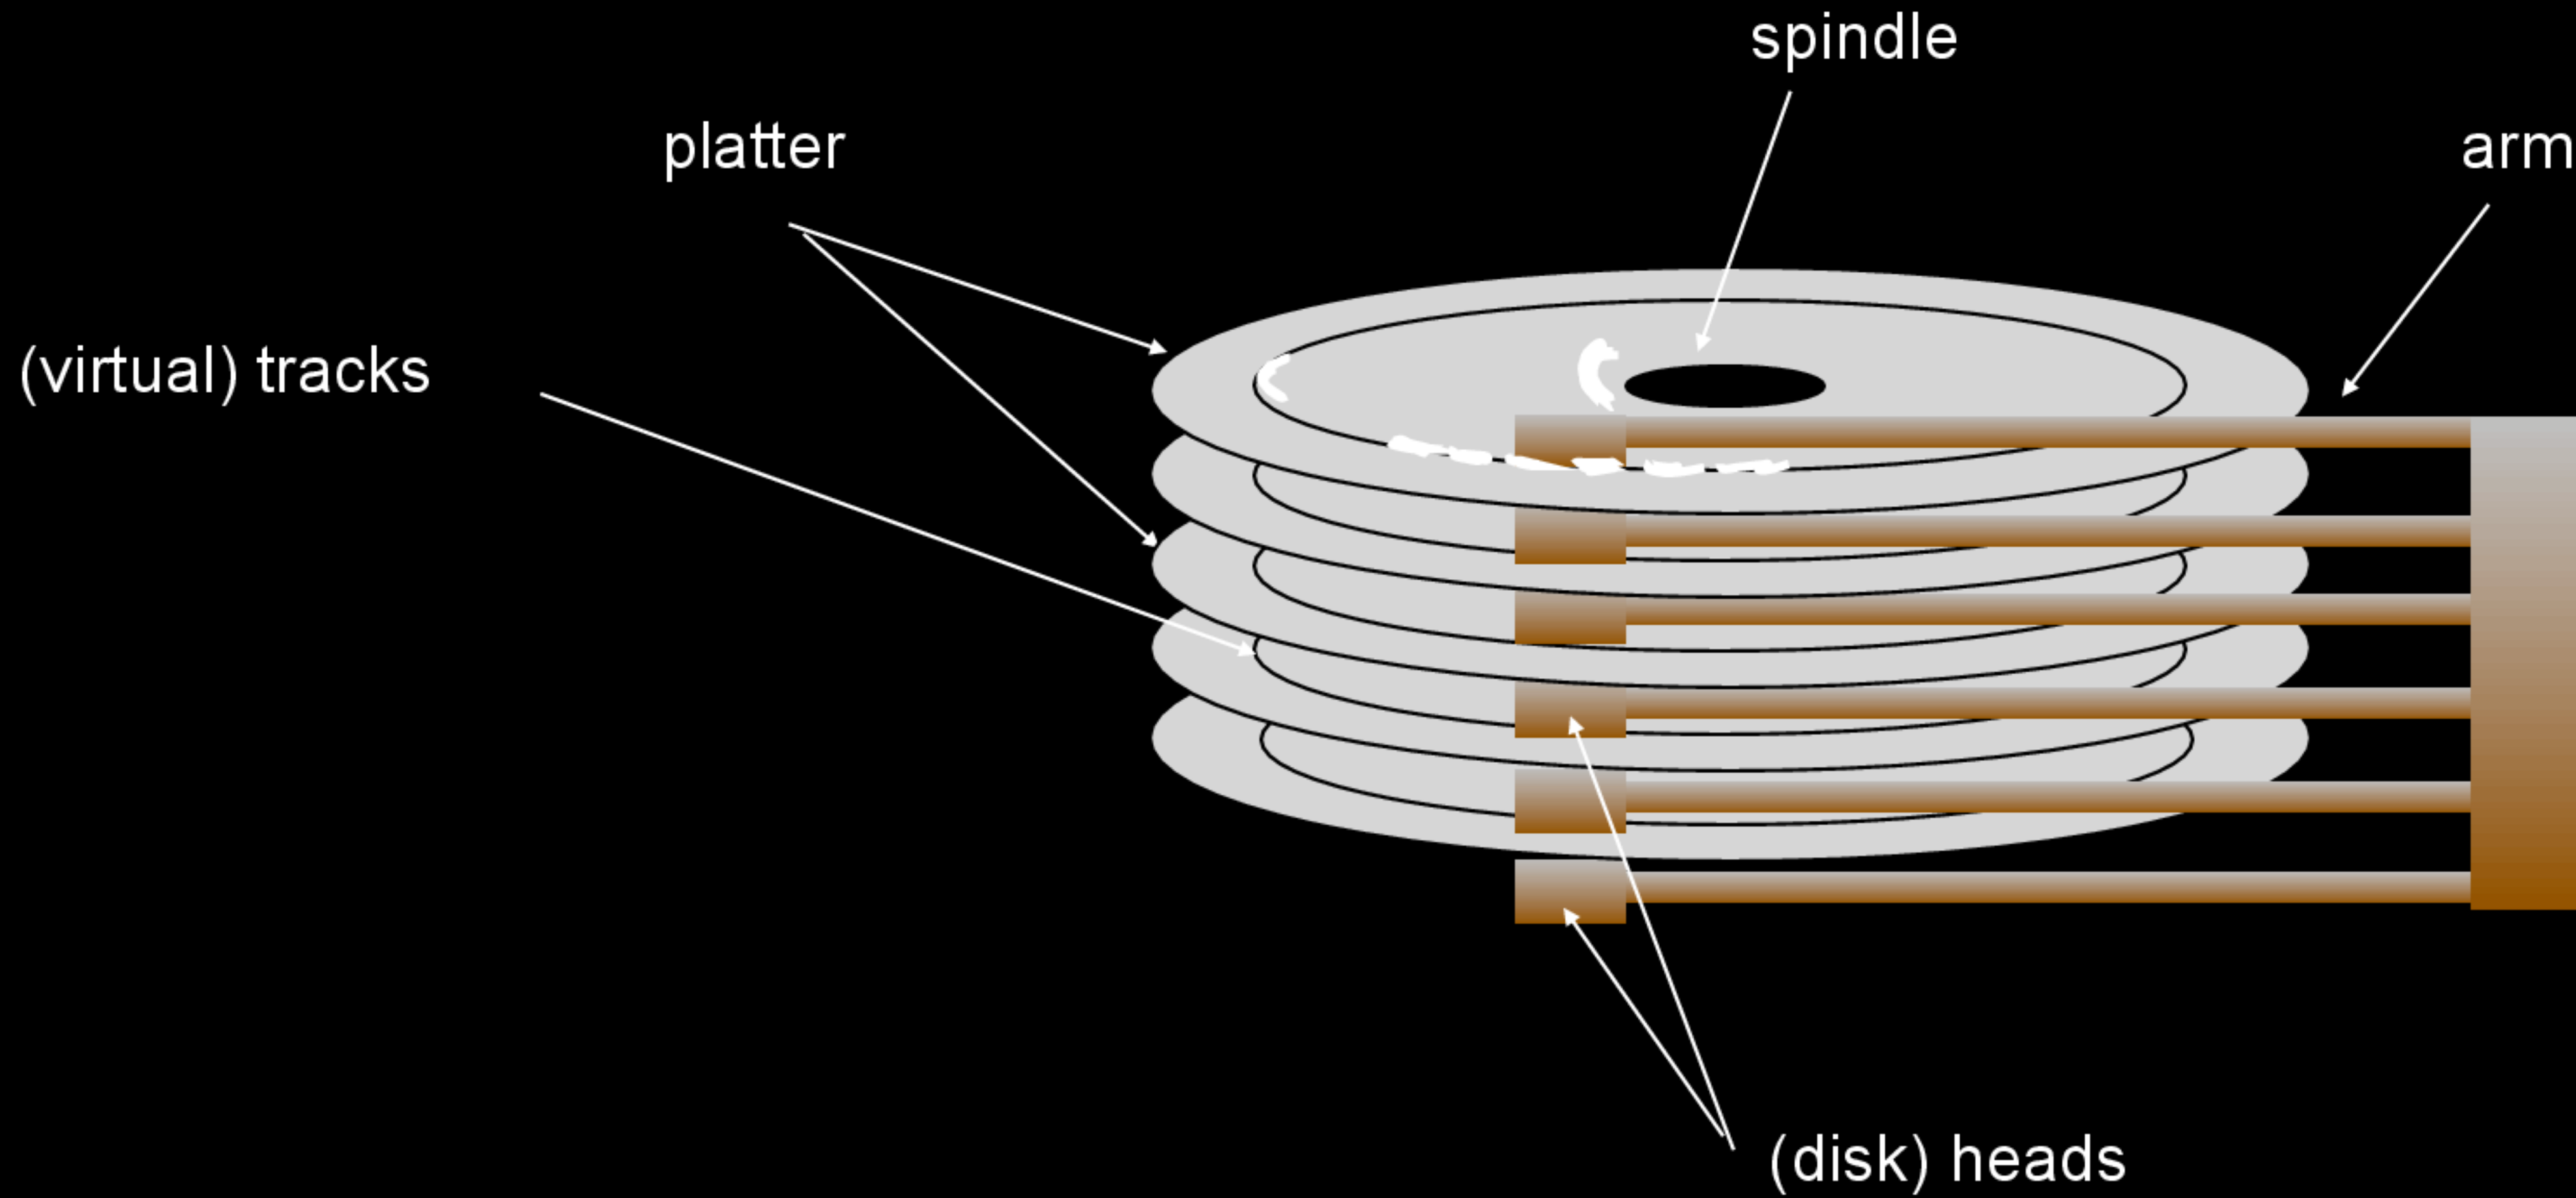

$$\Rightarrow 200 \text{ KPS}$$

$$\frac{1}{200} \text{ sec}$$

$$t_r = \frac{1}{400} = \underline{2.5 \mu s}$$

Sequential Access

cylinder = set of similar tracks
for all platters

Cost of a Sequential Access

1. seek to cylinder t_s (arm movement)
 2. rotational delay t_r (wait for the right angle)
 3. transfer time t_{tr} (transfer the actual data)
-

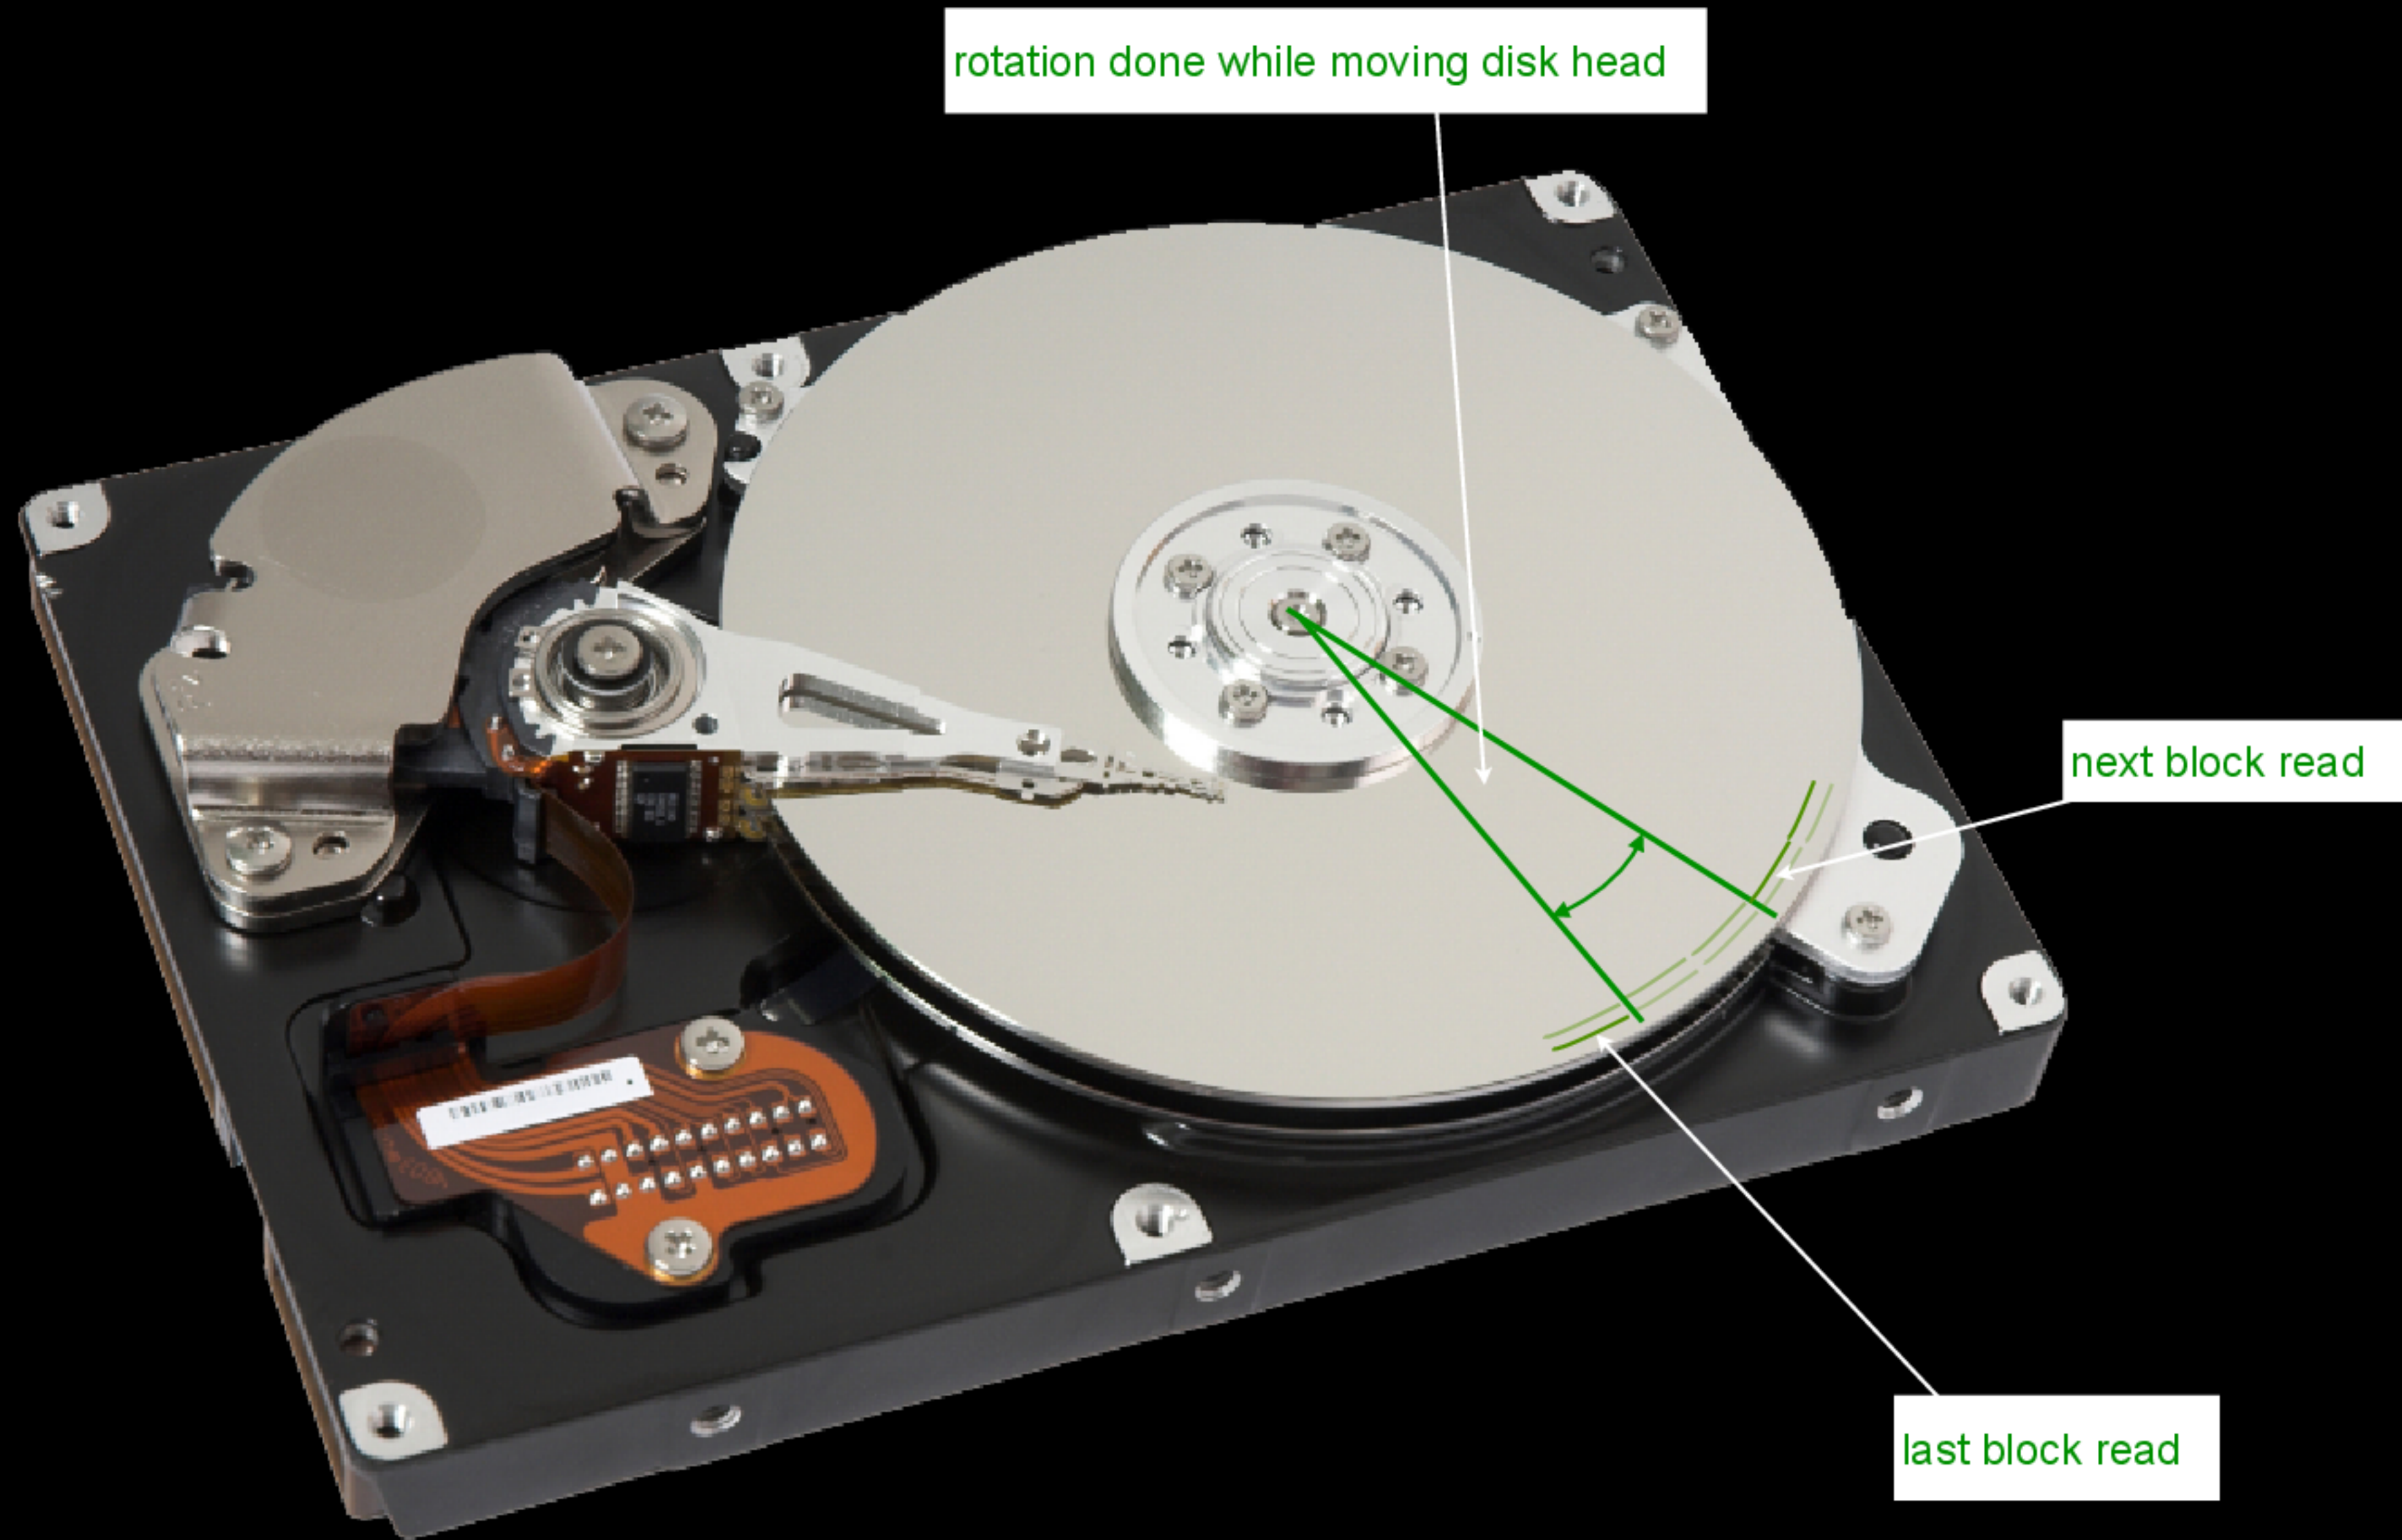

Cost of a Sequential Access

1. seek to cylinder t_s (arm movement)
2. rotational delay t_r (wait for the right angle)
3. transfer time t_{tr} (transfer the actual data)
4. switch to different head on the same track
5. rotational delay t_r (wait for the right angle)
6. transfer time t_{tr} (transfer the actual data)

Hard Disk Evolution

	1970	2012	improvement factor
	IBM 3330	Seagate Savvio 15K.3	
average access time	30ms	5ms	6
sequential	0.8MB/sec	174MB/sec	218

Simulation: Read 1,000 blocks of size 8 KB

TR: transfer rate in MB/sec

① each block **randomly** read:
 $t_{\text{random}} = 1,000 \times (\text{avg access time} + 8\text{KB/TR})$

Simulation: Read 1,000 blocks of size 8 KB

TR: transfer rate in MB/sec

each block **randomly** read:

$$t_{\text{random}} = 1,000 \times (\text{avg access time} + 8\text{KB/TR})$$

(2)

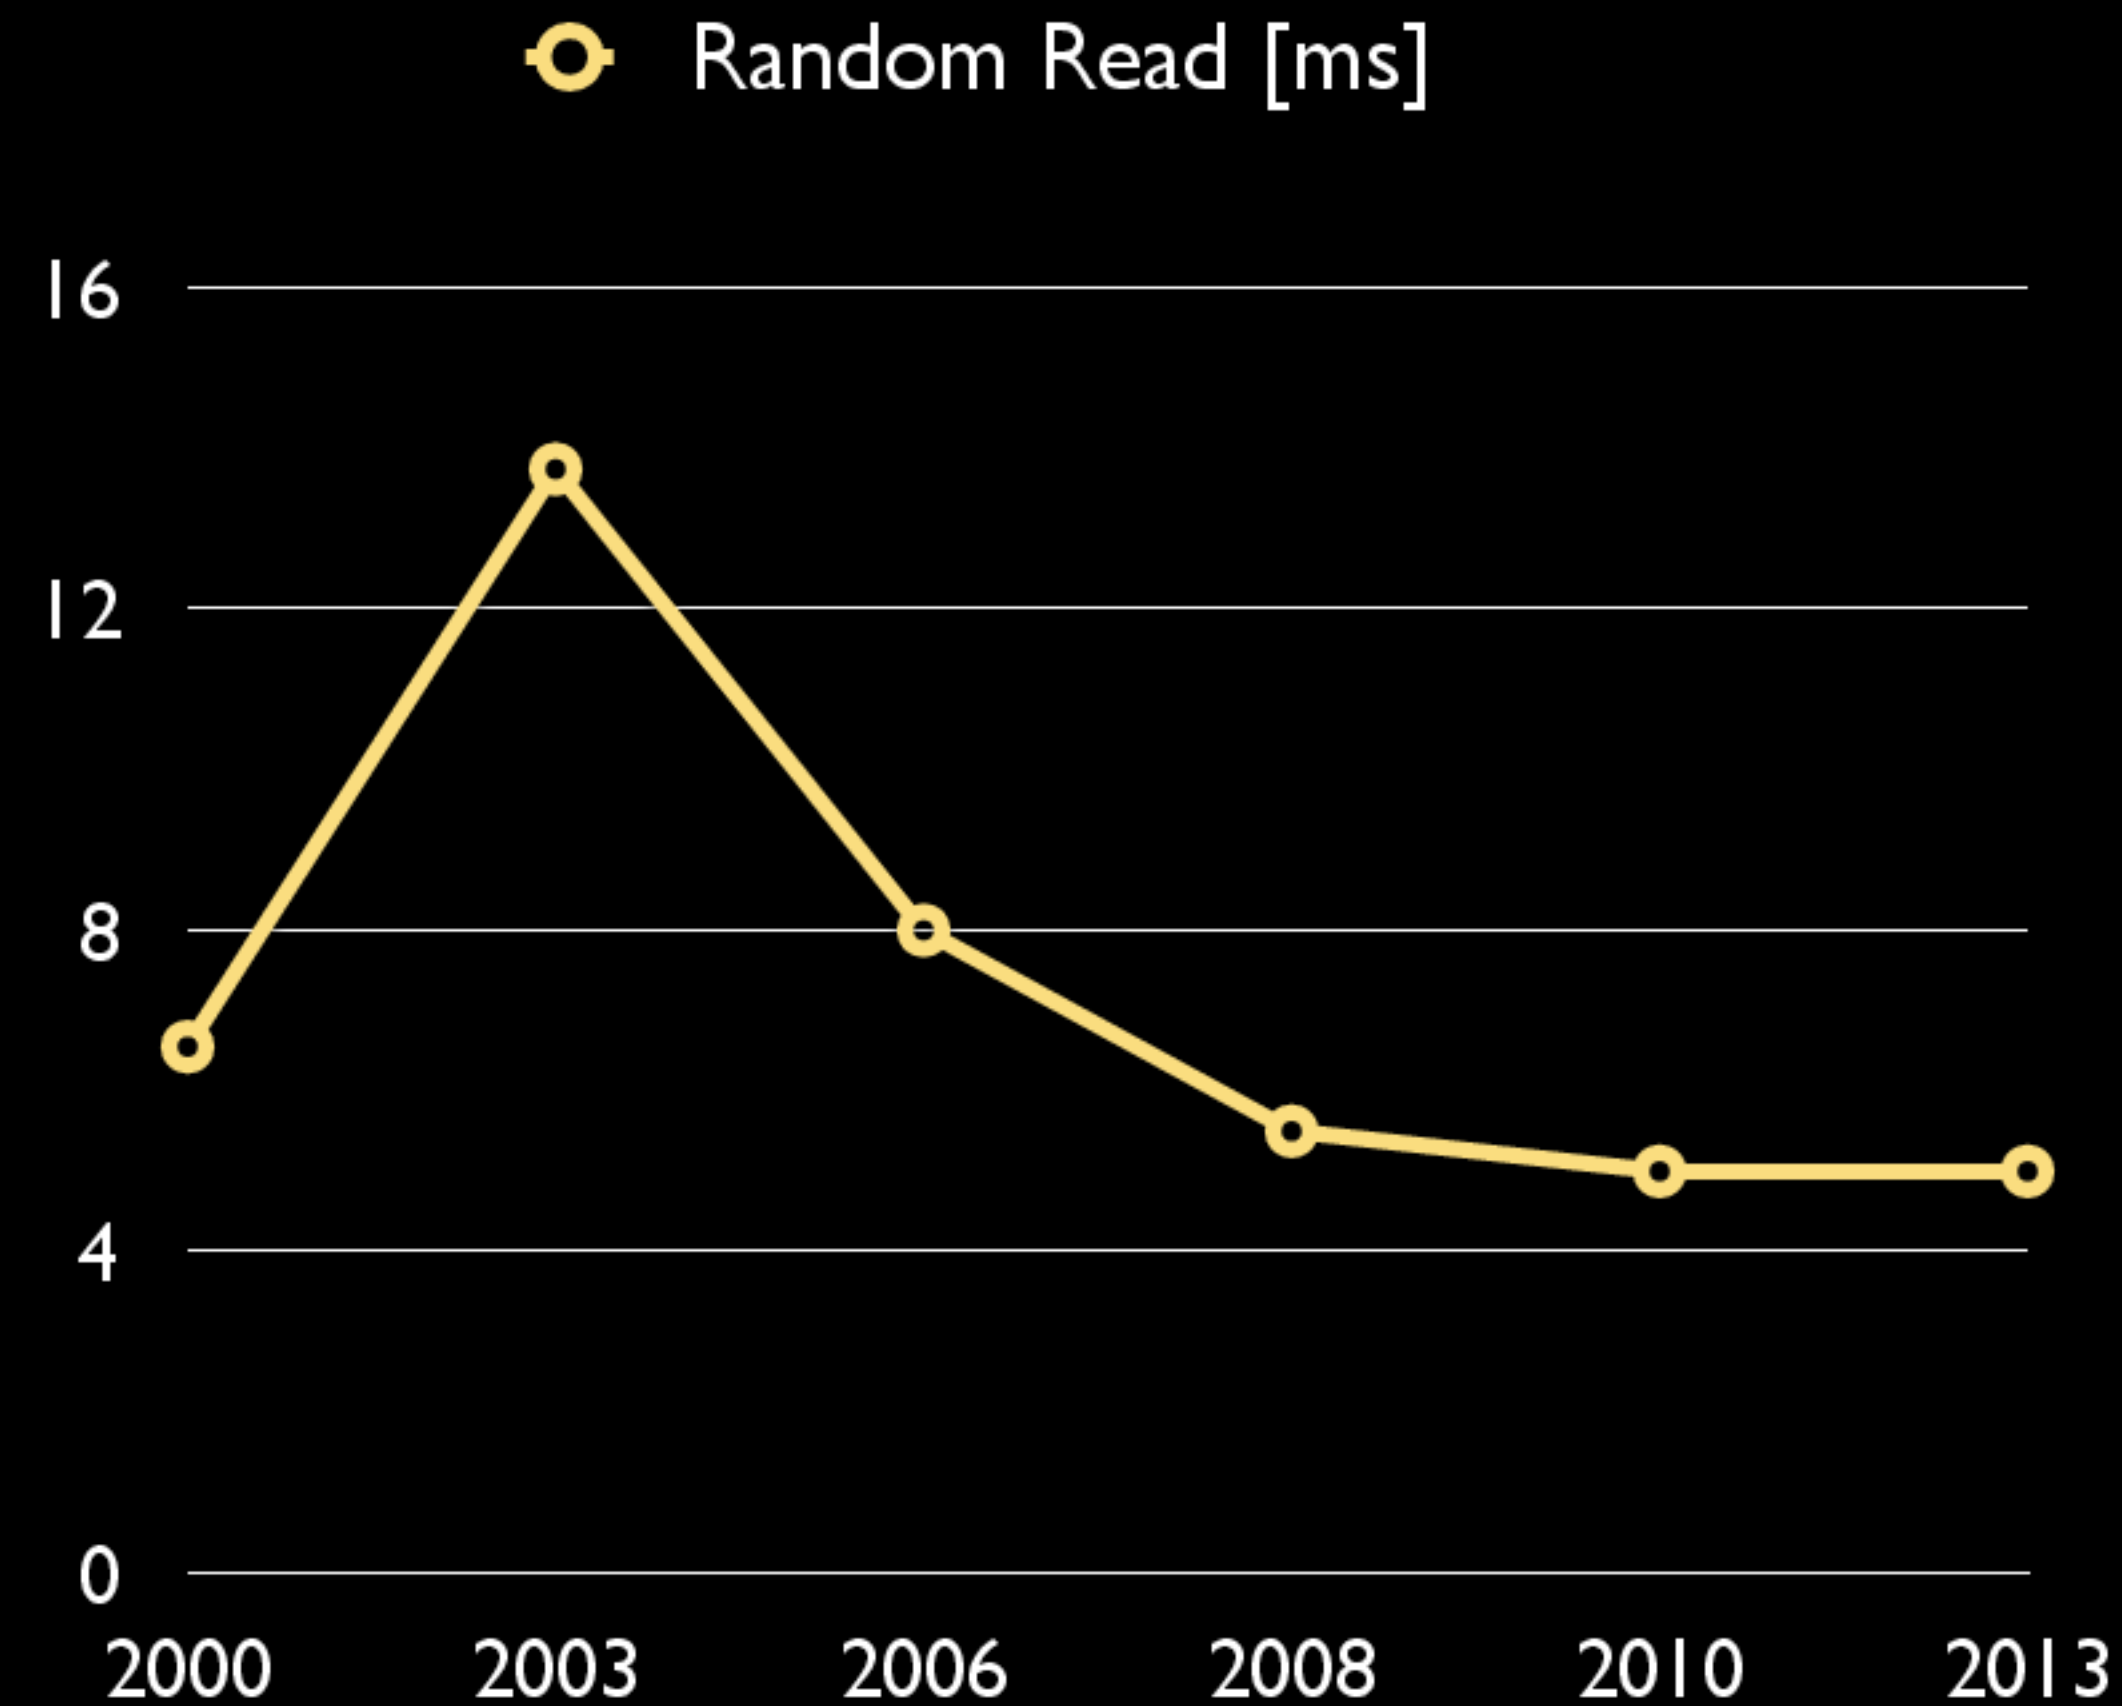

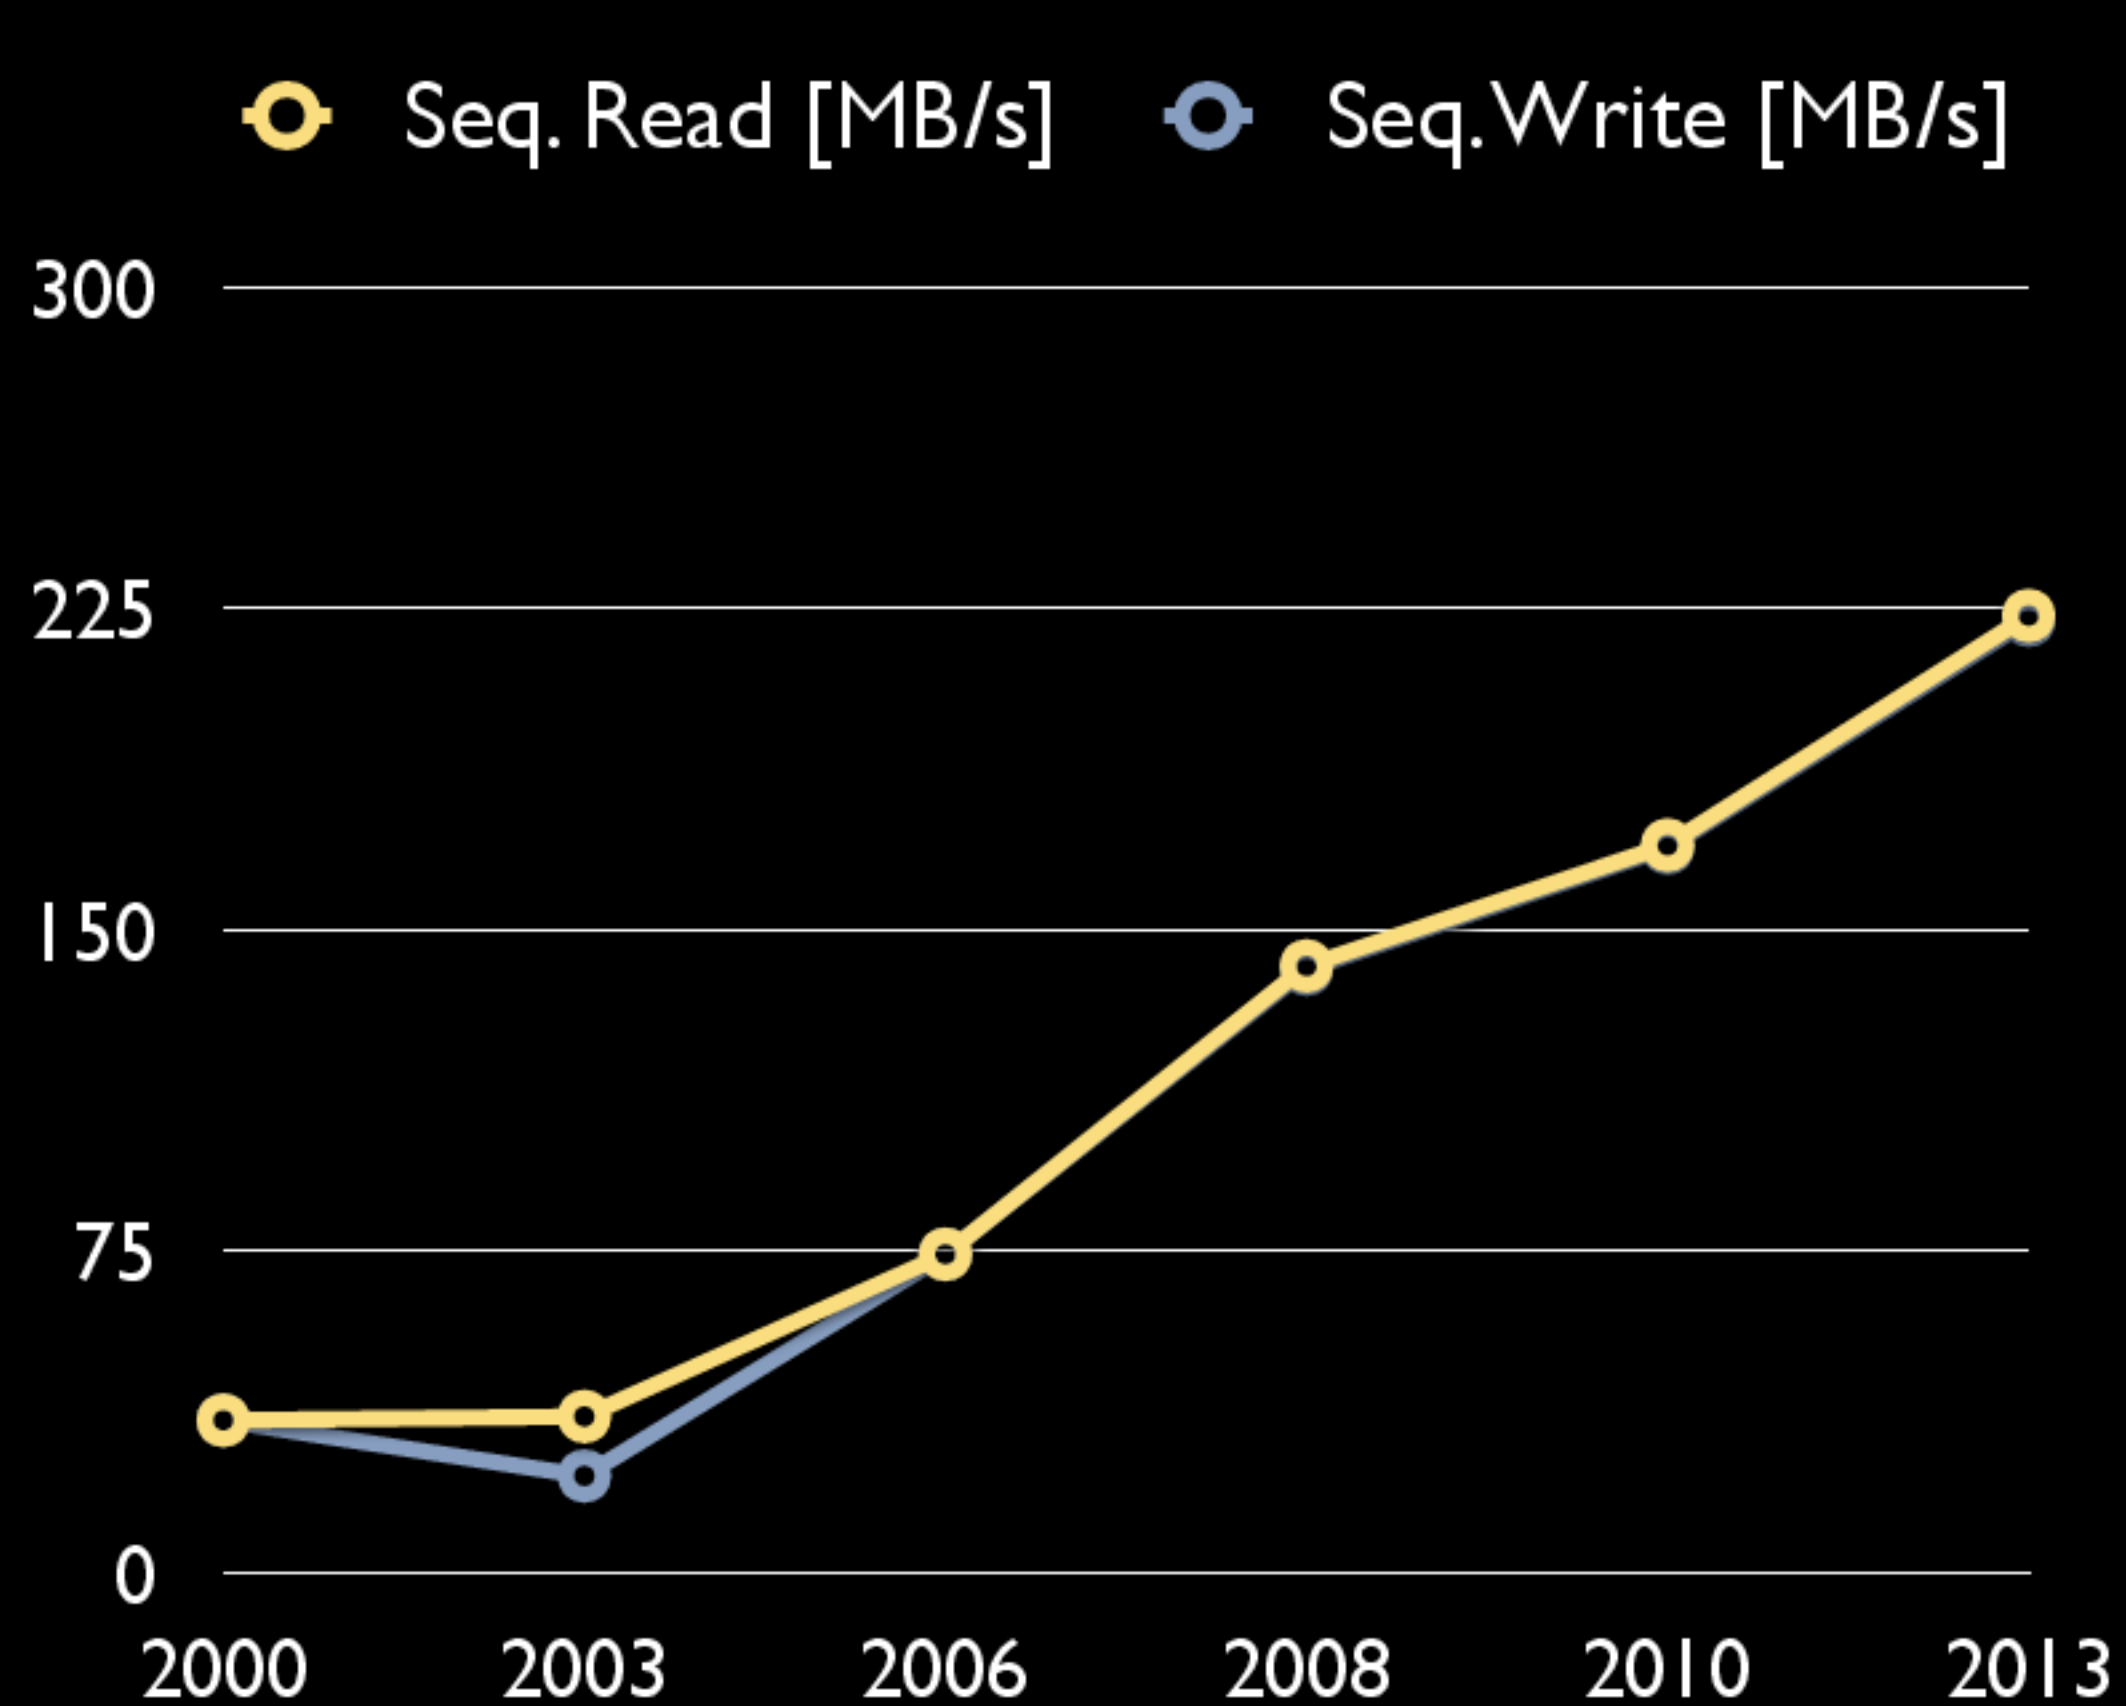

sequential read:

$$t_{\text{seq}} = 1 \times \text{avg access time} + 1,000 \times 8\text{KB/TR}$$

Simulation Results

	1970	2012	improvement factor
	IBM 3330	Seagate Savvio 15K.3	
each block randomly read	40,410ms	5,046ms	8
sequential read	10,440ms	51ms	205
improvement factor	4	99
